

10 ways to modernize your boutique hotel.

Closing the gaps against the bigger hotel franchises.

The gap between a 40-room boutique and a Marriott is not the rooms. It is the back office. Big chains have armies of engineers, an IT department, a corporate help desk, an annual training budget, and a CapEx line for technology. Boutique operators have a GM, a spreadsheet, and a phone full of contacts they hope they never lose. That asymmetry costs the boutique segment real money every month — in hours lost, in revenue left on the table, in guests who quietly choose the next-door property instead.

The good news: closing that gap in 2026 does not require an enterprise budget. It requires a list. Ten moves, most of which can be started this week, most of which cost nothing to begin, and all of which have been adopted at scale by the chains for years. The properties that work through this list run circles around the ones that do not — and they read as "tight" to guests in a way that translates directly into review scores, direct bookings, and rate flexibility.

This is that list. Ten ways, ordered by the hours and the guest impressions they win back per dollar of effort. For each one, we cover what it is, what it costs you not to do, what good looks like when it is done well, and where the common pitfalls are. Where relevant we also explain how the MyHotelOps stack handles the move, so you can either replicate it on whatever tooling you already use, or have it solved on day one by signing up.

A note on sequencing: you do not need to do all ten at once. Most properties get the largest gains from steps 1, 2, and 3 in the first month. Step 5 — the marketing-modernization move most boutiques have left on the table entirely — is the highest-leverage addition for properties that have the operational basics in place. Steps 6–10 each fit into a single weekend.

1. Move maintenance off paper and onto a photo-first ticket.

If you do nothing else on this list, do this one. The single highest-leverage modernization move at a boutique property is replacing the paper logbook (or the WhatsApp thread, or the notepad behind the front desk) with a system where every ticket starts with a photo and a room number and ends with an after-photo.

The reason it works is not the software. It is what the software enforces. A photo collapses the gap between "the bathtub is chipped" and "fix this specific bathtub by 3 PM." The room number tag collapses the gap between "there is a leak somewhere on the third floor" and "312 needs the engineer now." The after-photo collapses the gap between "marked complete" and "actually complete" — the gap that historically eats your weekends.

What it costs you not to do: at most boutique properties the median maintenance cycle from guest report to resolved fix is 2–3 days when run on paper, versus under 4 hours when run on a photo-first ticket system. That delta translates into roughly one negative review per month at a 40-room property, and somewhere between 4 and 6 hours a week of GM time spent re-asking, re-tagging, and re-chasing tickets that have been sitting in someone's phone.

What good looks like: front desk takes the photo. Engineering sees it on a phone within minutes. The ticket carries the room, the priority, the reporter, and a clock. The fix happens. The after-photo gets uploaded. The ticket auto-closes with a timestamped audit log the owner can scan at the end of the month. Recurring preventive items (HVAC filter, fire-extinguisher inspection, ice-machine descale) are on the same board, surfacing on schedule, owned by name.

Common pitfalls: do not let "the WhatsApp group" stand in for a ticket system. Group chats lose tickets the moment a non-maintenance message lands on top of them, and they have no audit trail when ownership asks what happened on the third Saturday in March. Do not skip the after-photo step — without it, "closed" tickets quietly reopen as guest complaints two weeks later, and you cannot tell which fixes actually stuck.

How MyHotelOps does it: Work Orders is a Kanban board with photo-first capture, per-property reference numbers (WO-0042), owner-override completions, and an audit log. Recurring preventive templates, SLA timers, and a vendor magic-link portal for outside contractors. Bundled into the \$100/property base — no per-seat or per-ticket charge.

2. Replace the laminated in-room card with a QR arrival page.

Walk into any boutique property and you will find some version of the same artifact on the desk: a laminated card with the Wi-Fi password, the breakfast hours, the front desk extension, and a sun-faded photo of a sandwich. It was printed in 2019. The Wi-Fi password is wrong. Nobody on staff knows who is authorized to update it.

Replacing it costs a few cents per room. Print a QR code per room that opens a branded arrival page on the guest's phone: the current Wi-Fi password, current restaurant hours, room service menu with photos, spa hours, gym info, a short neighborhood guide. The guest scans it with the camera app they already have open. No app install, no account, no login.

What it costs you not to do: in 2026, a guest who has to call the front desk for the Wi-Fi password registers your property as "behind." Chain hotels have moved this surface online entirely; an Airbnb stay has a digital welcome page; a boutique without one reads as a property that is not quite paying attention. The cost is invisible per stay and very visible at the quarterly review-score reconciliation — the missing 0.2 stars between "great" and "would book again" almost always trace back to small frictions of this shape.

What good looks like: the QR card is small, designed to match your brand, and printed alongside the room key cards. Scanning takes the guest to a fast-loading page that opens to your hotel's palette. The Wi-Fi password is one tap to copy. The dining hours reflect what is actually open today, not what was printed in March. The page does not ask the guest to sign in. The neighborhood guide is five to seven specific recommendations with a one-sentence

reason each — not "great cafe nearby," but "Padaria de Belém, 8 minutes on foot, the pastéis de nata you actually came for."

Common pitfalls: do not gate the page behind an account login. Do not embed third-party widgets you cannot brand. Do not put the page behind the captive portal that gates the Wi-Fi — the guest cannot read the page until they connect, and they cannot connect until they read the page. The page should live on the open web and load instantly.

How MyHotelOps does it: Branded Arrival Pages render from your hotel brand, your Wi-Fi credentials (imported from the IT Hub), and your menus. Printable QR cards generated for every room. Part of the optional Guest Experience add-on at \$39/property/month.

3. Pull every operational record into one source of truth.

Find the binder behind the front desk. Find the Drive folder no one has updated since the last GM left. Find the notes app on the engineering manager's phone. Find the printout pinned to the bulletin board in the breakroom. Find the contacts in the GM's personal phone — the plumber she always calls, the locksmith with the master key history, the espresso machine technician with the warranty number. All five of these records claim to be the same source of truth. None of them are.

This is the most boring step on the list, and it is also the one that determines whether your property keeps running when the GM is on vacation, sick, or — eventually — gone. The properties that handle staff transitions well share one thing: when the outgoing GM hands off, the new GM does not inherit a phone full of contacts. They inherit a system.

Pick one place. Move into it:

- **Wi-Fi credentials** — every network at the property, by purpose (guest, staff, back-of-house, event, IoT), with the right person authorized to rotate each one. - **Vendor portal logins** — booking engine, channel manager, accounting system, payment processor, email service, signage tools, anything else with a recurring login. Password manager-style, with role-gated access. - **Equipment records** — serial numbers, install dates, warranty end dates, last-serviced dates, the model of every major piece of kit from the boiler to the espresso machine. - **Vendor directory** — plumbers, electricians, linen suppliers, food vendors, the carpet deep-clean company, the pest control vendor. Name, role, contact, contract terms, what they were last called for, when. Tag by property if you run more than one. Surface "last called 14 months ago" as a preventive opportunity before it becomes an emergency. - **Floor plans, brand assets, contracts** — the foundational documents the property needs to operate but rarely opens. One canonical version, not three near-identical copies in different folders.

Make it searchable. Make it role-gated so the front desk does not have ownership-tier access and ownership does not have to ask the front desk for the spa Wi-Fi password.

What it costs you not to do: every time something breaks at 11 PM and the on-shift manager has to text the GM for the warranty contact, you pay the labor cost twice and the resolution-time cost on top. The annualized cost of "scattered operational knowledge" is one of the

larger hidden line items at a boutique, and it accelerates with staff turnover — every departing GM takes a slice of it with them. The cost compounds: vendors a junior staff member found via Google charge retail; vendor relationships that took years to build evaporate inside one staffing change.

What good looks like: one searchable directory with role-based access. Front desk can see Wi-Fi and dining info but not vendor portals. Engineering can see equipment, warranties, and vendor contacts but not ownership financials. Owners see everything. When a staff member leaves, you close one account; you do not change six passwords. The on-shift manager at 11 PM can find the right answer to "the boiler is making a noise" in under 30 seconds, alone, on their phone.

Common pitfalls: do not use a generic shared Drive folder as your source of truth. They have no role-gating, no search, no audit log, and they accumulate near-duplicates with names like "Vendors_FINAL_v2.xlsx." Do not let any individual staff member be the de facto registry for any category of operational information — that is a single point of failure dressed up as institutional memory.

How MyHotelOps does it: the IT Hub holds Wi-Fi credentials, vendor logins, equipment + warranties, the vendor directory with last-called dates, floor plans and brand assets, and a per-org document repository — all in one searchable, role-gated place. Included in the \$100/property base.

4. Run every screen at the property from a browser, not a USB stick.

The lobby board, the breakroom display, the pool deck sign, the meeting room screens — at most boutique properties, each of these is driven by a different contraption. One is a USB stick that gets refreshed by whoever is on shift. One is a Chromecast that someone configured in 2021. One is a laptop on a shelf running a PowerPoint deck nobody can edit.

Modern signage runs from a browser. Any TV with a browser — a Fire TV stick, an Onn., a smart TV — can become a managed screen by pairing it once with a code on a dashboard. From then on, scheduling, content updates, playlist changes, and emergency overrides all happen from the GM's phone in the lobby, not from someone climbing on a chair behind the pool deck TV with a USB stick.

What it costs you not to do: per-screen SaaS pricing on the standalone signage tools (Yodeck, OptiSigns, Raydiant) ranges from \$8 to \$30 per screen per month. At a typical boutique with 8 screens, that is \$64–\$240/month for a feature your team mostly does not use because the workflow to update content is on someone else's laptop. Operators end up either overpaying or running the screens on USB sticks; either path loses. The hidden cost is content that goes stale — the lobby screen still announcing the New Year's brunch in late March because nobody knows how to change it.

What good looks like: any browser-capable TV at the property is a screen. Schedule playlists by time of day and zone (breakroom plays staff content, lobby plays guest content, pool deck plays weather + spa hours). Emergency takeover is one click. The front desk can update a single screen in 30 seconds without escalating to engineering. Three or four screens are

enough; some properties run twenty without re-pricing.

Common pitfalls: do not buy purpose-built "signage hardware." A \$50 Fire TV stick on any TV does the same job for a quarter of the price of a "professional digital signage media player." Do not run signage on a single laptop in a closet — if the laptop reboots overnight for an OS update, every screen at the property goes dark until someone notices.

How MyHotelOps does it: Digital Signage works on any browser-capable TV via 6-digit pairing. Three screens included in the base; Signage Unlimited add-on is \$49/property/month for unlimited screens — break-even versus Yodeck at about 6 screens.

5. Take control of your hotel's social presence.

The independent hotel's social account, in 2026, has roughly two states. The first is silence — last post five months ago, comments unanswered, a profile photo from a renovation that finished in 2019. The second is the freelancer-managed account that posts twice a week in a voice that does not sound like the hotel and a visual style that could be any of three hundred other boutiques in the same city.

Neither of those is your hotel running its own social. Both of them are giving the channel away — the first to the void, the second to a stranger who does not know what your front desk smells like at 7 AM, or which guest cried at checkout last Tuesday, or what your bartender actually puts in the house cocktail.

The frustrating part is that, of all the marketing channels a 40-room independent fights for, social is the one you actually own. It does not take a cut. It does not rank you against a hundred other properties by who bid highest on the keyword. It does not insert a "member price" banner next to your room rate. If your social presence is good, it sends guests directly to your booking page. The whole margin is yours.

What it costs you not to do: a boutique hotel that brings 200 direct bookings a year through social, at a \$400 average daily rate over a 2.5-night average stay, books \$200,000 of revenue with no commission. The same room nights booked through the large OTA channels lose roughly 15–18% to the intermediary. That is somewhere between \$30,000 and \$36,000 of margin per year that turns on whether anyone is running the social account. We have walked through this math with owners of single properties and small groups; the number is almost always bigger than they expected, and it is almost always anchored to the same thing: not the number of followers, but the consistency of posting. A hotel that posts once a day is on the algorithm. A hotel that posts twice a month is functionally invisible. The follower count catches up later; the cadence has to come first.

The three reasons most independents have given up, in roughly this order:

- ****Time.**** The GM is running the operations side of a small business. Between covering a sick front-desk shift, ordering linen, dealing with a guest complaint, and signing off on payroll, the thirty minutes a day that good social content requires does not exist. It is not laziness; it is real arithmetic. - ****Voice.**** The hotels that did the obvious thing — hired a freelancer or an agency — mostly ended up regretting it. The posts are technically there. They look fine. They

sound like every other hotel's posts. The thing that made the boutique a boutique — the specific tone, the inside jokes with regulars, the owner's slightly-too-strong opinion about pastries — gets sanded off in the handoff. What is left is a feed that any chain could be running, posted by a contractor who has never set foot in the building. - **Cost.** The freelancer who does keep some of the voice is \$200–\$400 a month per property, and is usually managing three other accounts that month, and is also asking for access to your password manager and a list of recurring photo subjects. The math works at scale, but for a single property it is a real line item that has to be defended every quarter.

What good looks like: one post a day, every day. The caption sounds like the GM wrote it on the way to breakfast. The image is from the property's own catalog when the moment is local, and from a stock travel source when the angle is destination-style (the cathedral down the street, the airport on a Sunday evening, the autumn light on the local park). Three habits, kept up for ninety days, will move the needle on a small property's direct-booking traffic more reliably than any paid-search campaign of similar cost.

Common pitfalls: do not chase followers, chase cadence. Do not buy followers; they are visible and harm the credibility you actually need. Do not let a freelancer post in your voice without thumbs feedback — generic outsourced content actively damages an independent brand. Do not OAuth your hotel's social accounts to a scheduling tool unless you understand the security tradeoff; a third-party tool with token access can post on your behalf if it is breached, and you will not always be able to tell who posted what.

How MyHotelOps does it: Social Studio drafts one on-brand post per property every morning — caption, hashtags, suggested photo from the property's own media library or a destination-photo source when the catalog does not cover the angle. The GM picks the variant, copies it, and publishes it themselves. We never log into Instagram, never schedule on your behalf, never ask for your social passwords. Thumbs up/down on each draft trains the brand voice over time. \$19/property/month — meaningfully cheaper than the freelancer it replaces, and the voice gets sharper not flatter as time passes.

6. Take event proposals off Word and onto a tracked pipeline.

For properties that take weddings, corporate offsites, or even modest private dinners, the difference between booking the event and losing it to a competitor is usually measured in days of response time. The standard boutique workflow — inquiry email lands, GM retypes the details into a Word template, sends a PDF, the thread gets buried in a Sent folder — costs days at every step.

Put inquiries on a pipeline. Each inquiry has a state (new, proposed, negotiating, booked, lost), an owner, and a clock. The proposal is generated from a template that pulls your spaces, your menu pricing, and your terms. The signed version becomes the invoice automatically. Nothing gets retyped twice.

What it costs you not to do: a single recovered wedding inquiry is typically a four- to five-figure event. Most boutiques lose 20–40% of their event inquiries to slow-response competitors, and the lost ones are silent — they never write back. At a property doing 30 event inquiries a quarter, that is anywhere from \$40,000 to \$200,000 a year walking away

without a "no thanks." The pipeline view is the only way to see those losses, and seeing them is what changes them.

What good looks like: every inquiry is on a board the moment it lands. The proposal goes out the same day, branded and complete. The client signs from their phone. The contract becomes an invoice. Payments are tracked against the invoice without a separate billing tool. The events lead can look at the quarter and see exactly what kind of inquiries convert and what the average proposal value is — real revenue intelligence most boutiques have never had.

Common pitfalls: do not let the proposal template drift from reality. If the food-and-beverage minimums or the venue fees on the template are out of date, the proposal goes out wrong, and the client either bails or the property eats the gap. Do not let inquiries sit in the events lead's personal inbox — they are a shared resource and have to live in a shared place. Do not skip the "lost" state when a deal goes silent; tracking lost inquiries is how you spot a pattern (which time of year, which event type, which competitor) you can actually act on.

How MyHotelOps does it: Events & Catering runs inquiry !' proposal !' invoice in one place. Branded PDF proposals in minutes, payments tracked without a separate billing tool, an audit log per event, and a public proposal link the client can accept or decline from their phone. Included in the base.

7. Set up a one-click emergency broadcast for every screen.

Fire alarm, gas leak, weather evacuation, active incident in the neighborhood. The properties that handle these moments well have one thing in common: every screen at the property can be commandeered with a single click from any staff phone, and the message that goes up is already written and reviewed.

Set this up before you need it. Pre-build the templates for the three or four scenarios most relevant to your property and your city. Decide who is authorized to push them. Run a tabletop drill once a quarter so the front desk does not freeze the one time it matters. Print a small laminated card behind the front desk listing the exact button to press for the exact scenario — most freezing in the moment is not unwillingness, it is uncertainty about which button.

What it costs you not to do: the worst-case cost is human. The everyday cost is the staff confidence gap — a property where the team knows there is no plan is a property where the team will not improvise calmly when one is needed. Insurance reviewers are starting to ask, in 2026, whether a property has a documented emergency-communications protocol; not having one is becoming a premium item.

What good looks like: every screen at the property can be taken over from a phone in under five seconds. Pre-built templates for fire, weather, evacuation, "all-clear," and one or two property-specific scenarios (pool closure, elevator outage, valet redirect during construction). The push is logged with the staff member who pressed it. Drills are scheduled. The front desk knows where the button is, who is allowed to press it, and what the language on the screen will say.

Common pitfalls: do not write the emergency messages in the moment — they will be ungrammatical, internally inconsistent, and miss the action item. Do not let the templates drift out of date when the property's evacuation routes change (renovations, new exit signage). Do not assume the front desk will improvise; they will freeze.

How MyHotelOps does it: Emergency Broadcast is built into the signage module — pre-built templates for fire, weather, evacuation; custom messages anytime; one-click takeover of every screen at the property. Push history is logged by user. Included with the Signage Unlimited add-on.

8. Audit your monthly software stack and consolidate.

Pull every monthly SaaS invoice for the property — the PMS, the booking engine, the channel manager, the payment processor, the accounting system, the email service, the maintenance tool, the signage tool, the guest concierge tool, the social-scheduling tool, the document storage, the team chat, the survey tool, the analytics tool. Most boutique back offices have between 8 and 14 subscriptions running, and most operators cannot recite more than 5 of them from memory.

Sort the list by monthly cost. For each one, ask: is this actively used? By whom? When was the last login? What would break if we cancelled tomorrow? Tools that have not been logged into in 90 days almost always do not need to be paid for. Tools that overlap in function — two ticketing systems, two document stores, the maintenance app that has been replaced by but not unsubscribed from the new one — almost always need to be consolidated.

What it costs you not to do: industry data and our own conversations suggest the median boutique pays \$500–\$1,200/month in software subscriptions across all non-PMS tools, and 20–40% of that spend is on tools that are no longer used or that overlap with something else. Even at the low end, that is \$1,200–\$2,800 a year of pure waste. The hidden cost is bigger: every additional login is a tax on the team, every monthly reconcile is a tax on AP, every "where did we set up that vendor" question is a tax on institutional memory.

What good looks like: a back office with one PMS, one operations layer, one accounting integration, one payment processor — and not much else. A quarterly review on the GM's calendar to re-ask "is this still earning its keep?" of every subscription. The fewer logins your front desk needs to know, the faster they onboard and the less they leak when they turn over.

Common pitfalls: do not assume "we're already paying for it" is a reason to keep it. Sunk-cost reasoning is how the stack creeps from 5 tools to 14. Do not let department leads buy their own SaaS subscriptions without a central registry; that is how the same property ends up paying for two survey tools and three calendar tools.

How MyHotelOps does it: one operations layer covers maintenance, events, IT hub, signage, arrival pages, the document library, and the social-post generator — replacing 5–7 standalone tools at a single \$100/property base plus three flat-rate add-ons.

9. Stop sharing logins. Stand up role-based access.

The shared front desk login that has been on a sticky note since 2022 is the single largest security risk at most boutique properties, and it is also the single largest operational liability. When the dishwasher learns the front desk password because they used the lobby PC once, and they leave on bad terms two months later, you do not know what they took.

Give every staff member their own login. Give every role the access they need and no more. Front desk sees bookings and guest messages. Housekeeping sees room status and maintenance tickets they reported. Engineering sees the maintenance board. Owners see everything. When someone leaves, you turn off one account; you do not change six passwords.

What it costs you not to do: shared logins are the leading cause of post-departure access incidents at small properties, and they are uninsurable. The bigger ongoing cost is operational — without per-user logins, you cannot tell who closed which ticket, who approved which invoice, who pushed which signage update. You cannot run a real audit, which means you cannot resolve a real dispute. When a guest claims they were promised a comp by "someone at the front desk last Tuesday," shared logins mean you cannot prove or disprove it.

What good looks like: every staff member has their own login. 2FA is available, and required for ownership-tier accounts. Audit logs name names. The front desk turnover rate (which is real and unavoidable) costs you one account close, not a password reset across six tools. New staff get the right permissions on day one without ownership having to grant access by hand.

Common pitfalls: do not give everyone the maximum permission "to keep things simple" — that is the exact failure mode role-based access exists to prevent. Do not let 2FA be optional for ownership accounts. Do not let any password live on a sticky note, ever; if a staff member needs to write it down to remember it, the system is asking too much.

How MyHotelOps does it: per-user logins for every staff member, role-based access with granular per-module permissions, optional 2FA per user (mandatory for owner accounts when enforced org-wide), and a complete activity audit log. Unlimited team members at every role tier — no per-seat charges, ever.

10. Schedule a monthly "tech walk" of every guest-facing surface.

The most expensive form of digital decay is the kind no one sees because no one is looking. A QR card with a dead link. A lobby screen stuck on a six-month-old announcement. A bathroom signage placard the cleaning crew accidentally peeled off in March. A neighborhood guide that still recommends a restaurant that closed. A social post pinned to the top of the profile that references a since-departed chef.

Once a month, do a walk. Phone in hand. Scan every QR code. Watch every screen for a full minute. Read every printed card you would have read as a guest. Click every link. Open every social profile and check that the pinned post, the bio, and the most recent three posts still reflect the property. Note what is broken in the same ticket system you set up in step one.

What it costs you not to do: digital decay compounds. Every guest who scans a dead QR

code or sees a stale screen makes a quiet mental note that the property "is not paying attention." Those notes show up in reviews months later, by which time the source of the bad impression has been forgotten and the property cannot trace it back to its cause. Online surfaces decay the way physical ones do — they just decay invisibly until someone notices.

What good looks like: 45 minutes a month, on the GM's calendar, as a recurring event. The walk produces tickets, not just a vague feeling that "something looked off." The next month's walk verifies the previous month's tickets closed. The compounding hygiene effect is what separates the boutiques that age well from the ones that quietly drift toward "charming but a little chaotic."

Common pitfalls: do not skip the walk because "the last one was clean." Decay accumulates between walks regardless of how clean the last one was. Do not let the walk turn into a fix-while-you-walk session — log everything as a ticket, fix afterward in the right order. Mixing the two means small fixes get done and big ones get forgotten.

How MyHotelOps does it: every QR card, signage screen, arrival page, and daily social post is editable from the same dashboard the walk produces tickets in. Notes from the walk land in the same Work Orders board your maintenance team already lives in.

A note on how to sequence this

You do not need to do all ten at once. Most boutique properties get the largest gains from steps 1, 2, and 3 in the first month, and the largest cultural shift from step 10 in the second. Step 5 is the highest-leverage addition for any property that has the operational basics in place — it is also the one that most directly affects revenue, because it is the only marketing channel a boutique fully owns. Steps 4, 6–9 can each be one weekend. The goal is not to look modernized; it is to operate modernized. Guests will notice the outcome long before they notice the stack.

The chains have had these capabilities for a decade. The reason they did not become standard at boutique scale is not that they were too complex — it is that the tooling was priced for properties with 200 rooms and IT departments. That has changed. The same operational stack a chain runs now exists at a price a boutique can actually pay.

Save this guide. Forward it to the operations lead at the property down the street if you think they could use it. The boutique segment gets better when the floor gets raised on all of us.

How we put this together at MyHotelOps

MyHotelOps is the operations layer that runs alongside your PMS — Mews, Cloudbeds, Opera, Little Hotelier, RoomRaccoon. We do not replace your reservation system. We handle everything else: maintenance work orders (step 1), branded guest arrival pages and QR cards (step 2), an IT hub for Wi-Fi credentials, vendor logins, equipment + warranties, and the vendor directory (step 3), browser-based digital signage with emergency broadcast (steps 4 and 7), the Social Studio daily-post generator (step 5), event proposals and pipeline (step 6), role-based team access and audit logs (step 9), and the operational dashboard the monthly tech walk produces tickets into (step 10).

Pricing is flat per property. \$100/month base; optional Signage Unlimited at \$49/property/month; optional Guest Experience (arrival pages + QR cards) at \$39/property/month; optional Social Studio (one AI-drafted social post per property per day, in your voice, that you publish from your phone) at \$19/property/month. No per-seat charges. No per-screen charges. No per-room charges. One subscription line per property, billed in USD, on any major credit card from anywhere in the world.

A 40-room boutique buying the same surface à la carte from Quore, Yodeck, Duve, and a freelance social-media manager pays around \$679/month. With us, everything-on costs \$207/month per property — and you can drop any add-on with a single click. The first 7 days are free, with no credit card required to start. If you want to see whether the back office of your property looks better on this stack, start the trial at myhotelops.com/signup — it takes under a minute and your data persists if you convert.
